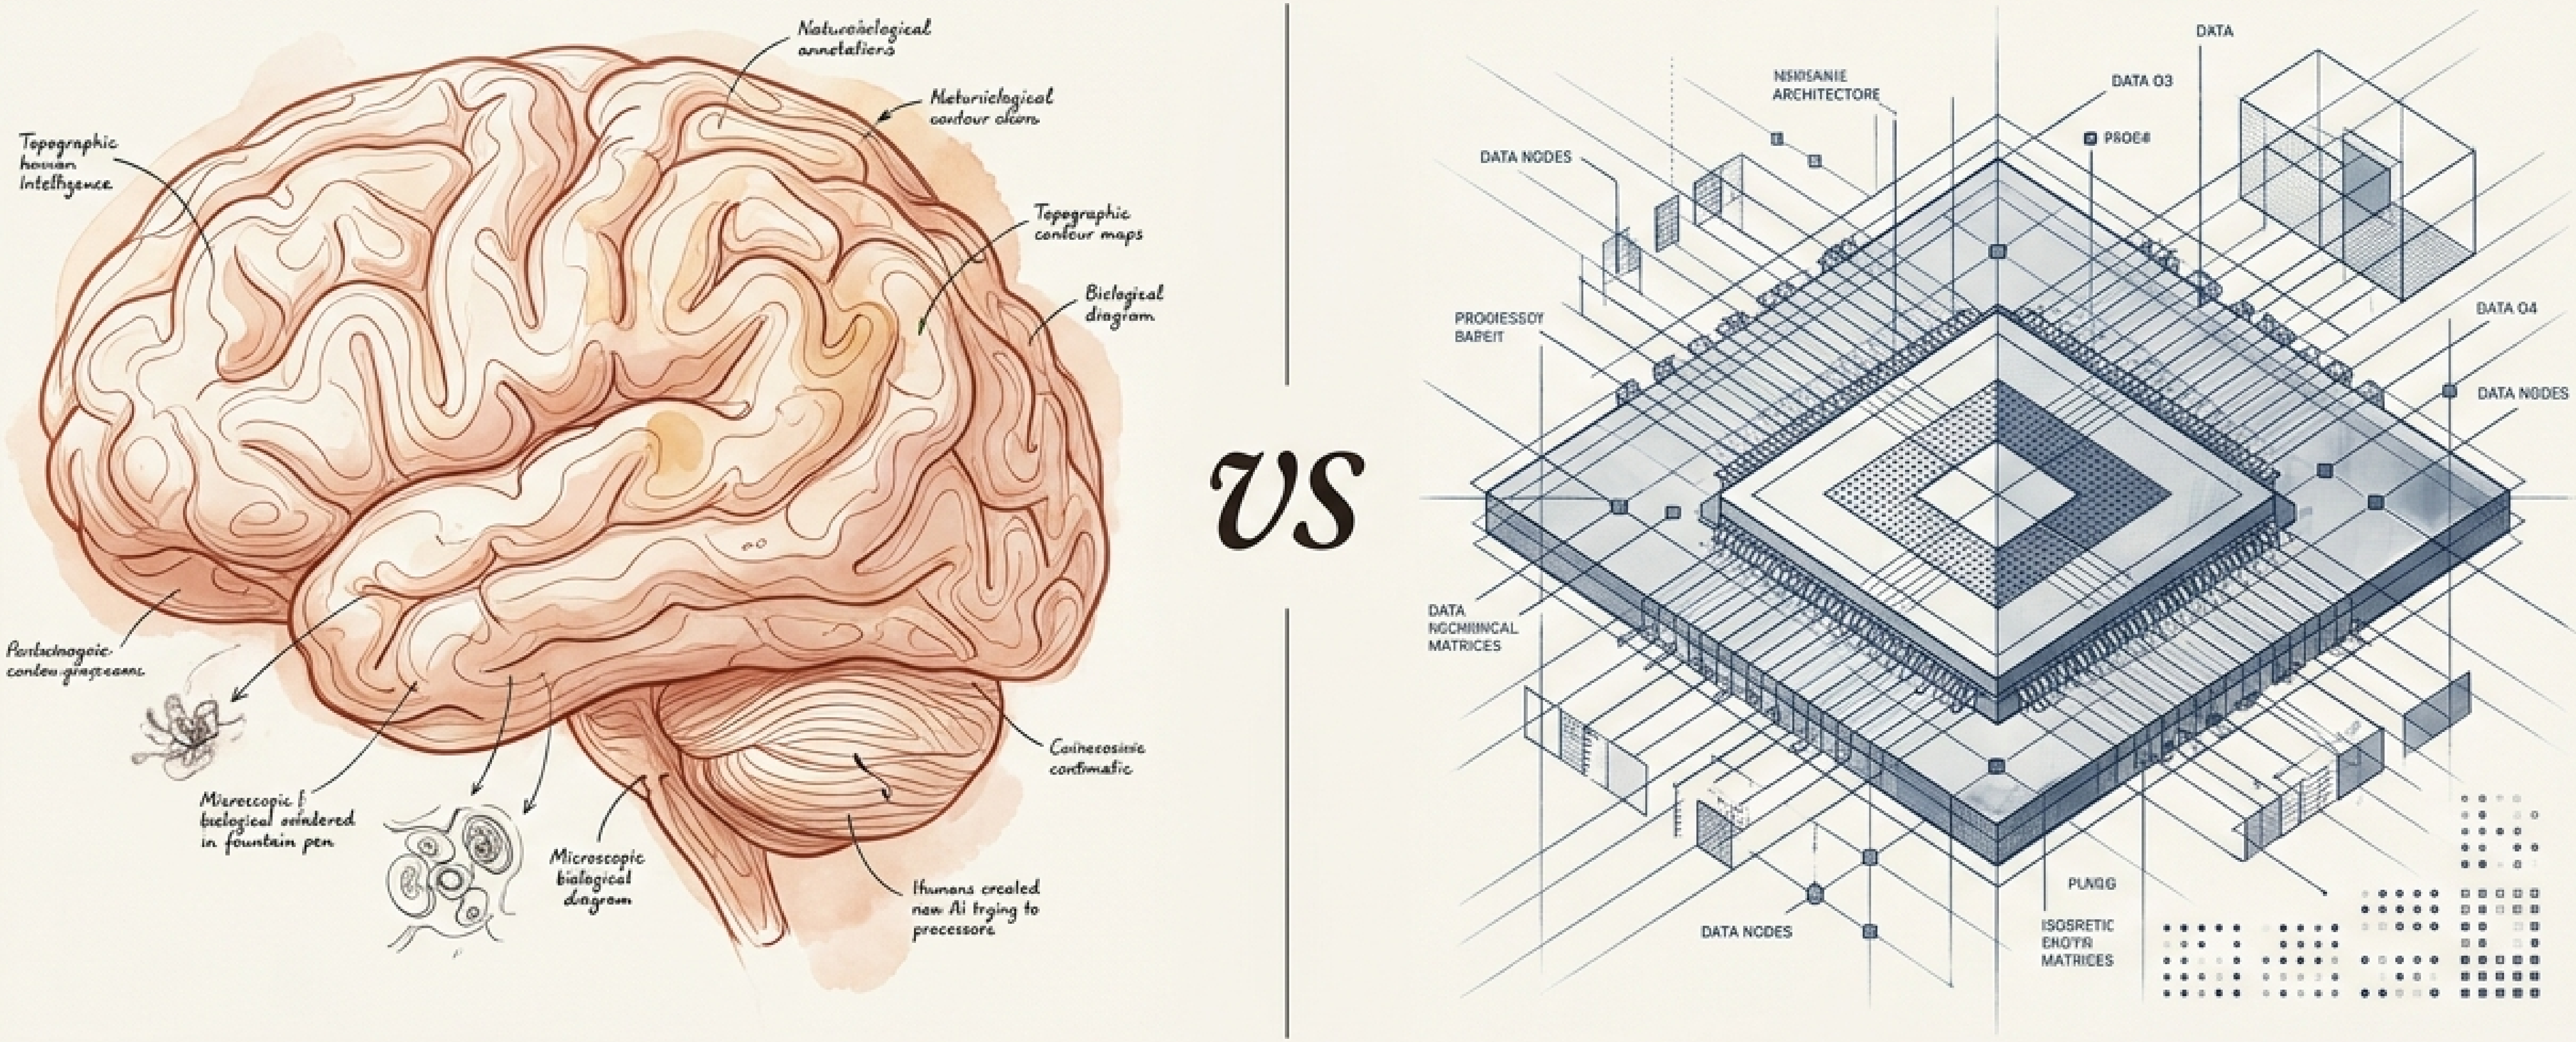
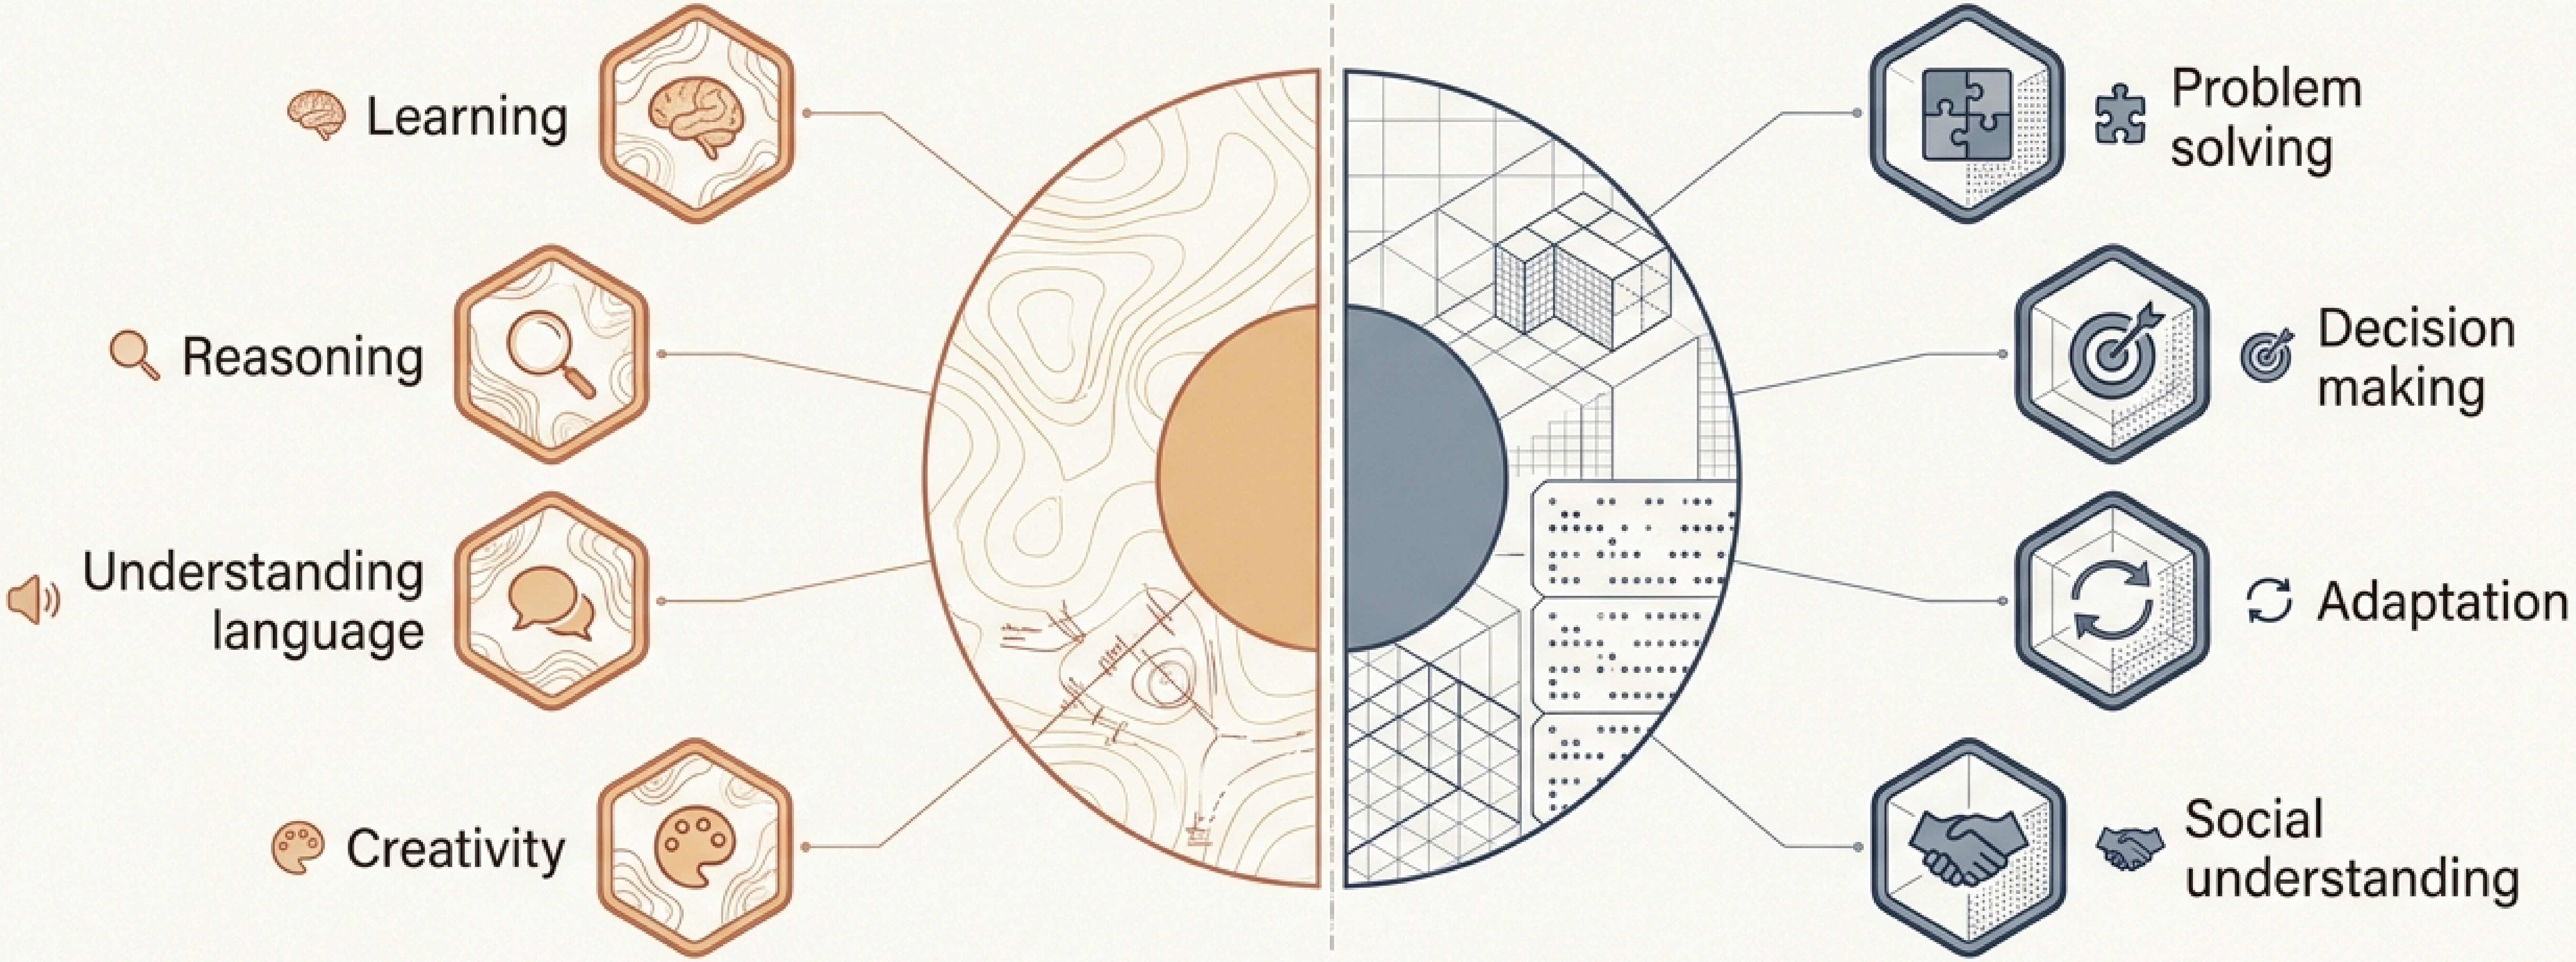
# AI vs Human Intelligence



Are machines actually intelligent?
Humans created AI... now AI is trying to understand humans. 💀

AI Meme University — 06

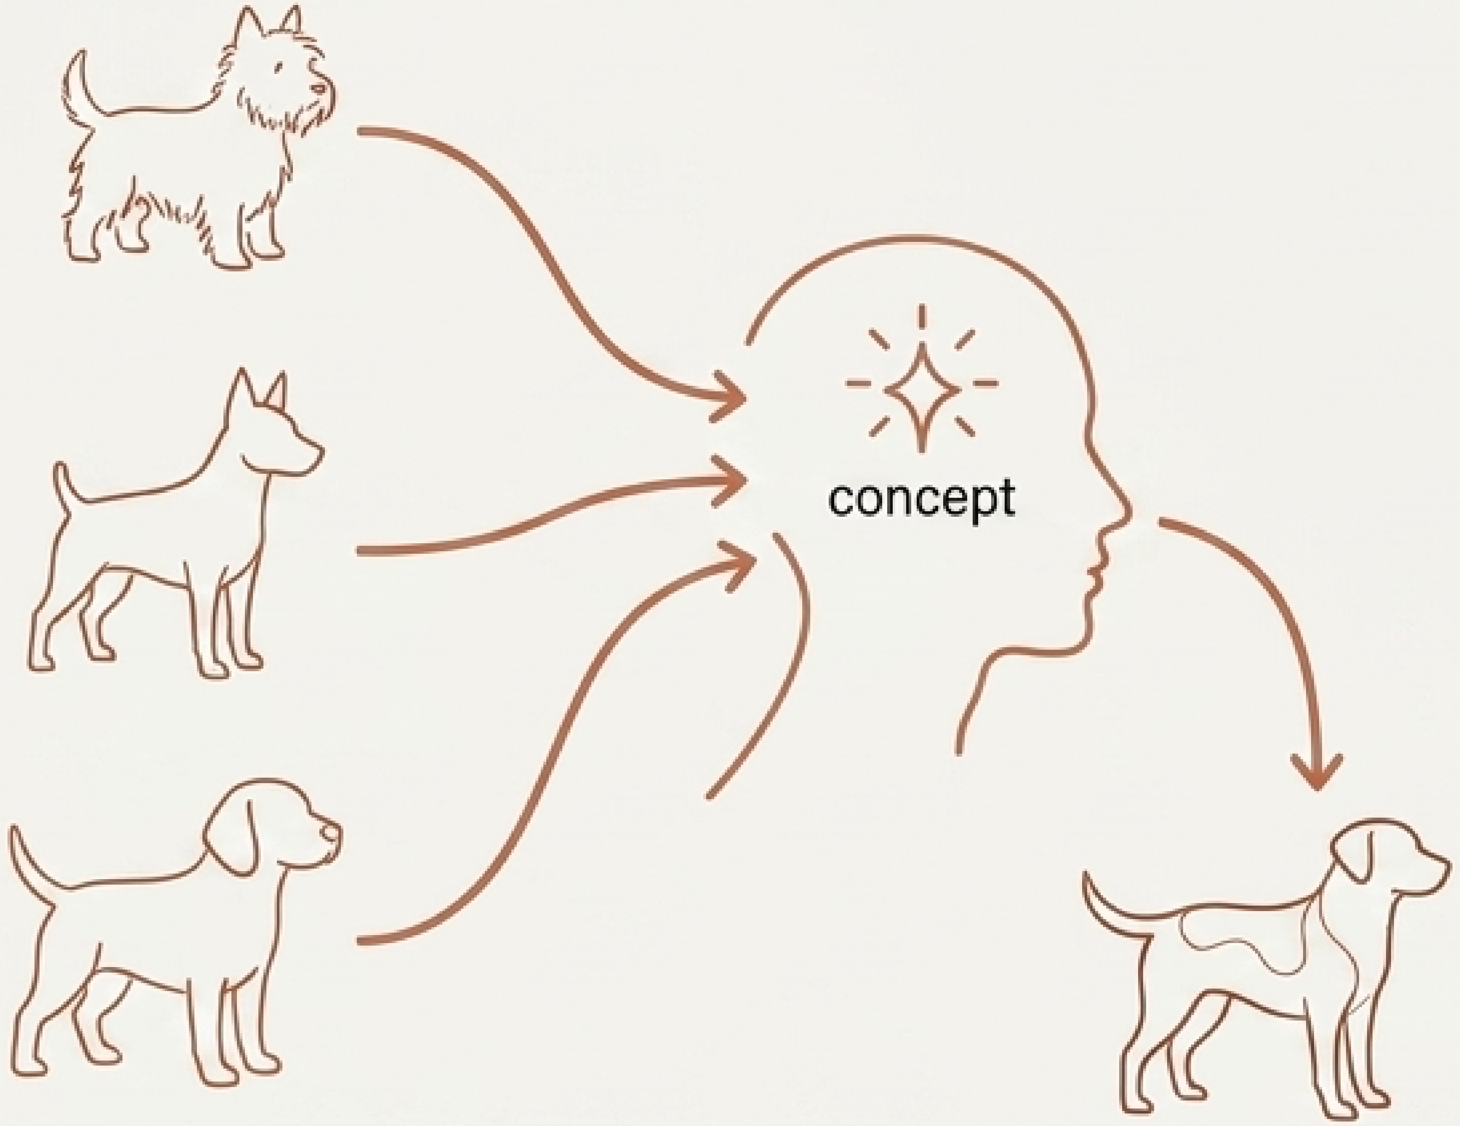
# There is no single universally accepted definition of intelligence.



The interesting question: Can machines have these abilities in the same way humans do?

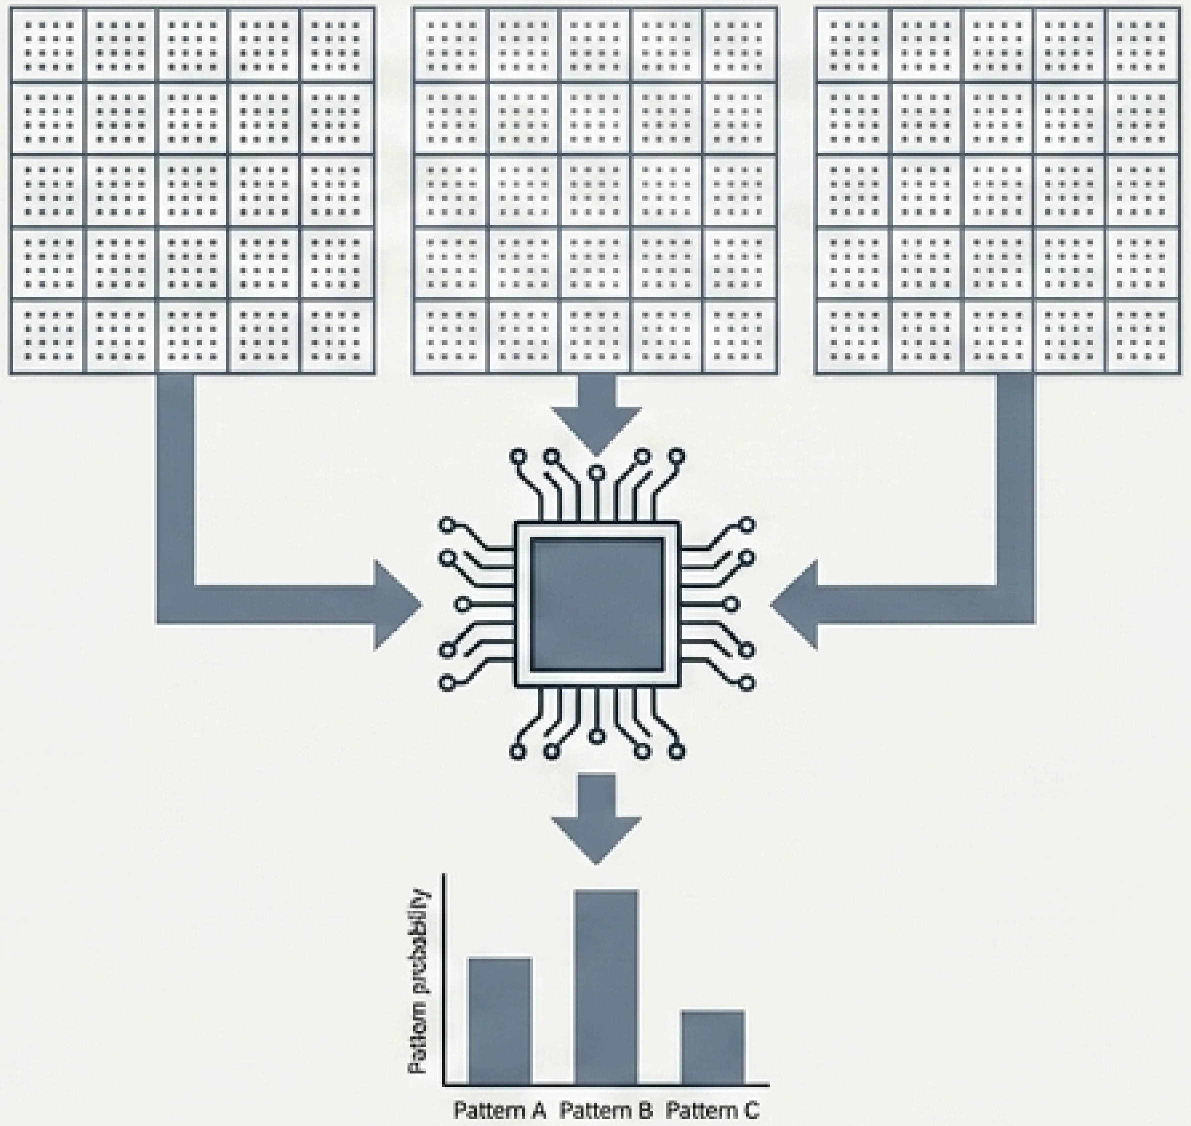
# The Blueprint of Minds

## Carbon



A child sees a few dogs, extracts the concept, and can instantly recognize a completely different dog.

## Silicon



AI models learn patterns by processing vast amounts of data.

Humans learn through rich real-world experience; AI systems learn according to their training process and available data.

# The Blueprint of Minds

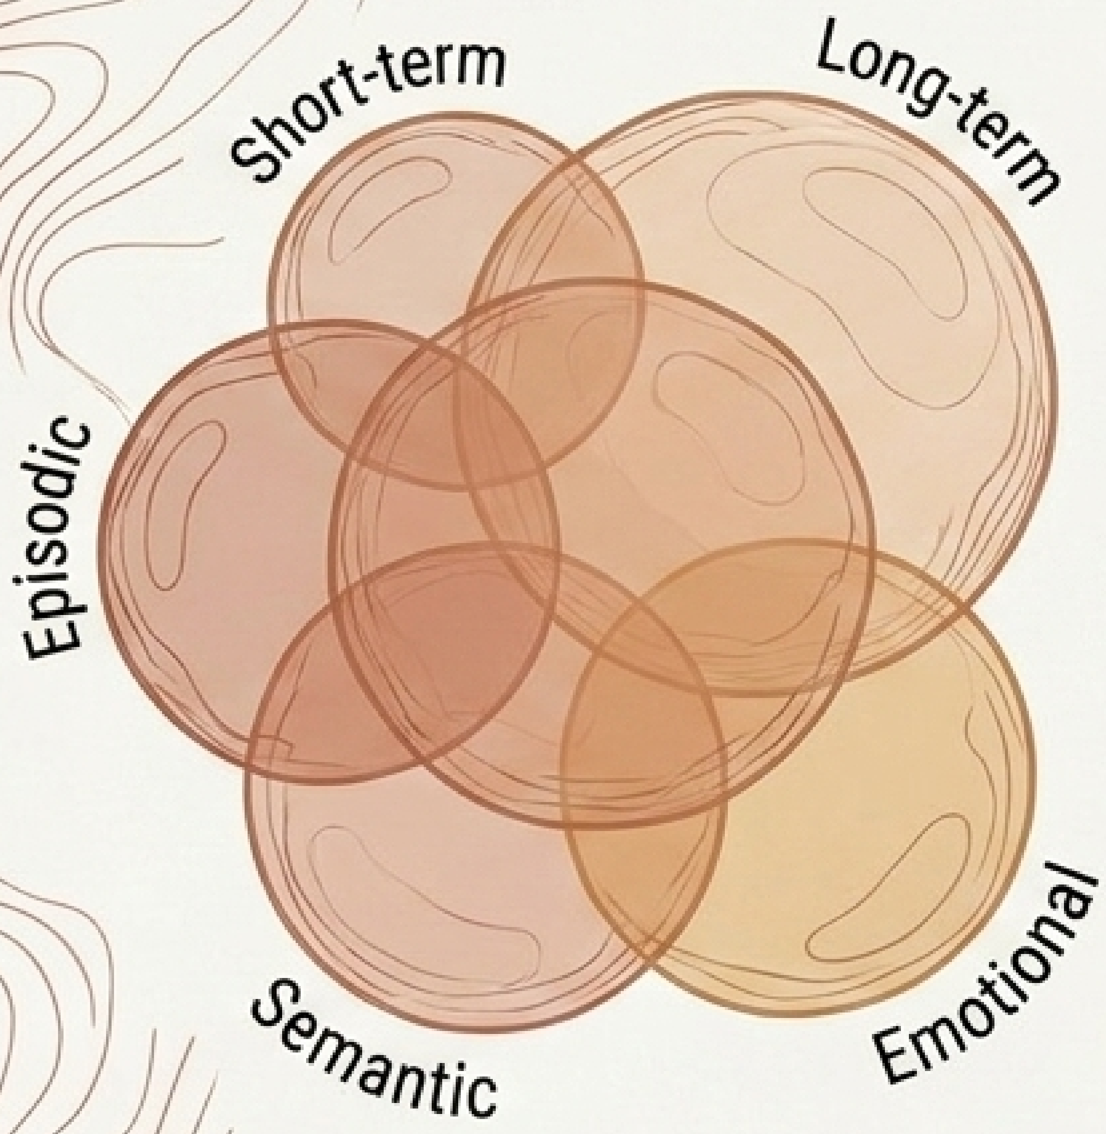
## The Mechanisms of Knowledge Acquisition

| | | |
|---|---|---|
| Can learn from few examples | **VOLUME** | Often benefits from large datasets |
| Uses multiple senses | **INPUT** | Usually receives specific input modalities |
| Uses prior life experience | **FOUNDATION** | Uses training data & model parameters |
| Continuously interacts with the world | **ENVIRONMENT** | Depends on system design |
| Highly adaptable | **FLEXIBILITY** | Adaptability varies |
| Can learn from explanation | **INSTRUCTION** | Some models learn from instructions/examples |

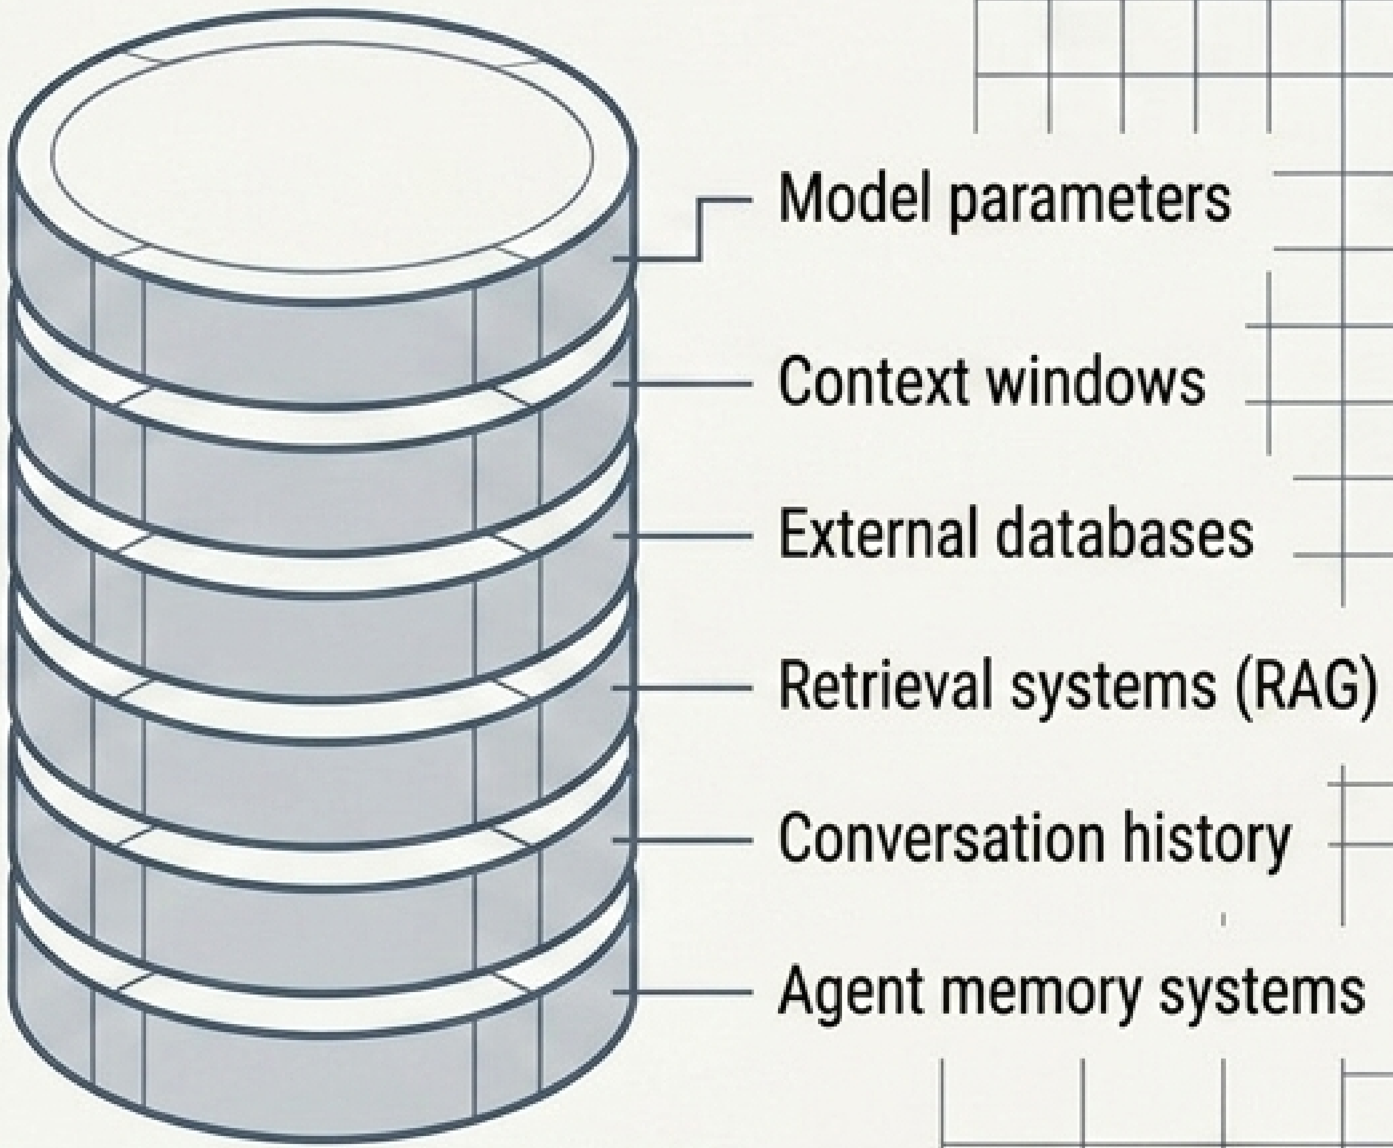
*Important: AI systems are improving rapidly, so these differences are not absolute for every system.*

# The Blueprint of Minds

## Biological Webs versus Computational Stacks

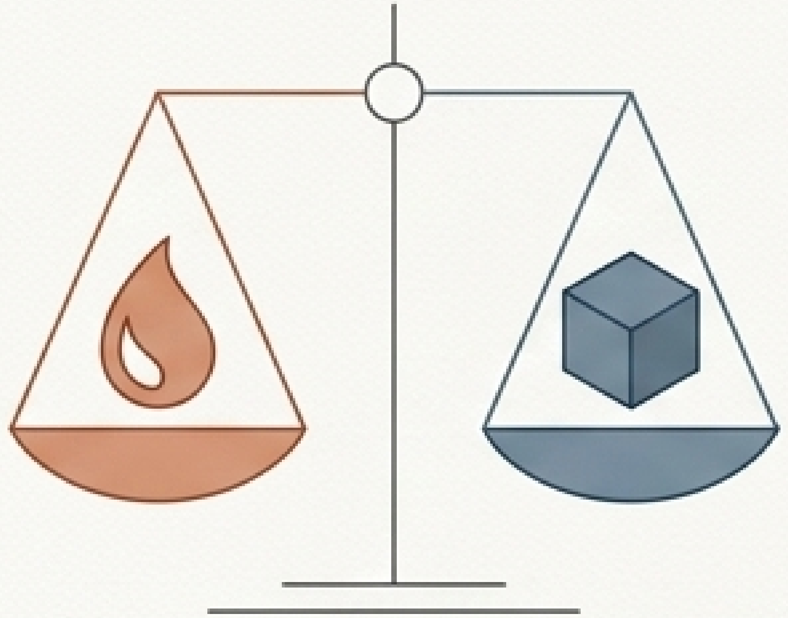


These mechanisms are not equivalent to human memory



# The Blueprint of Minds

The distinct ways Carbon and Silicon approach reasoning



## Carbon

- Apply common sense
- Use experience
- Understand context
- Make intuitive judgments
- Reason in unfamiliar situations

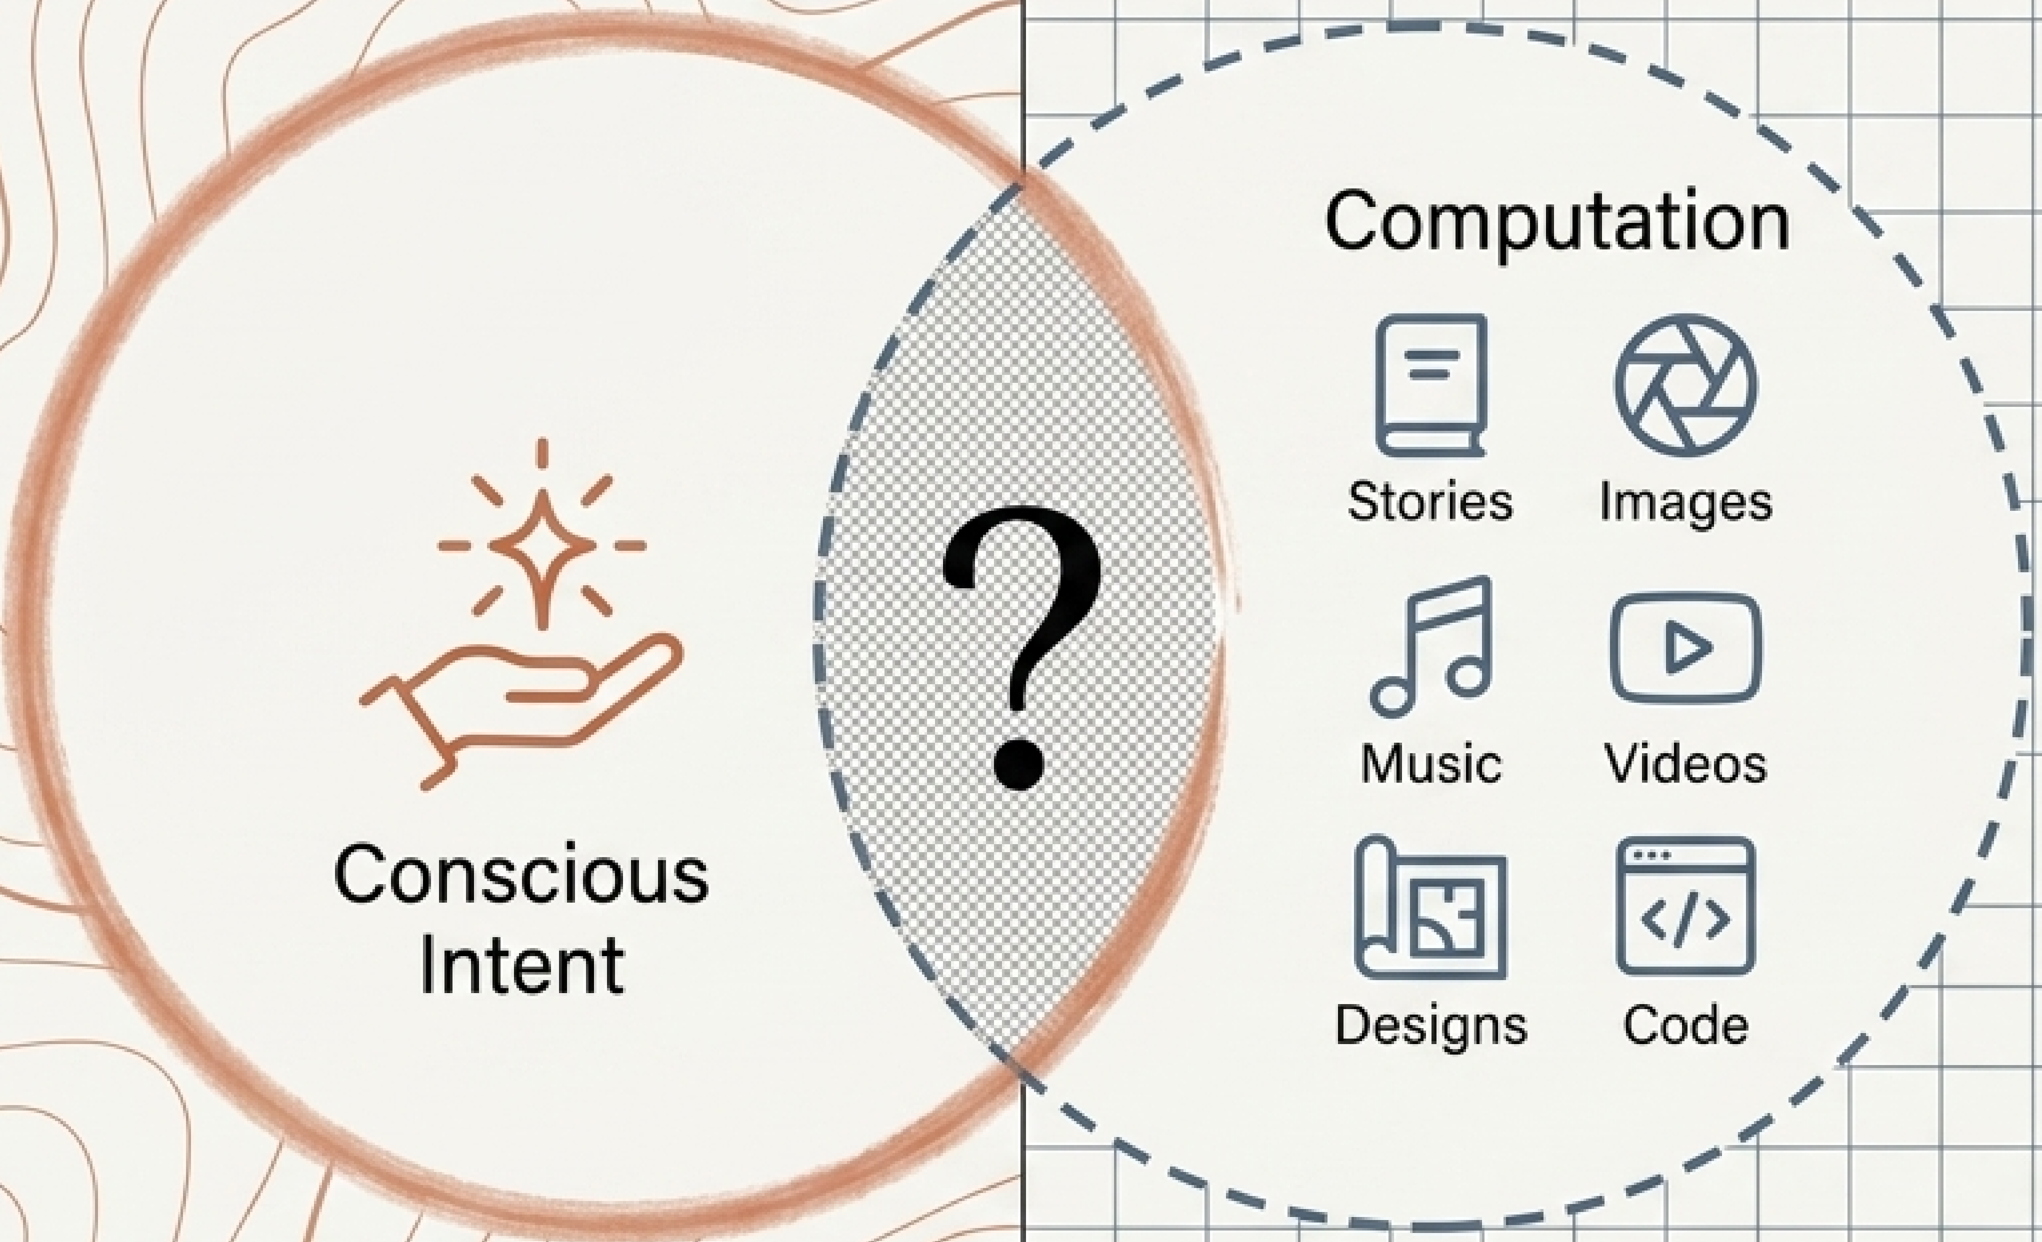
## Silicon

- Perform mathematical calculations
- Search patterns in huge datasets
- Follow logical procedures
- Generate possible solutions
- Process information extremely quickly

**But AI can also:**
Make confident mistakes, misinterpret context, produce hallucinations, fail on seemingly simple problems.

# Is generating something new the same as being creative?

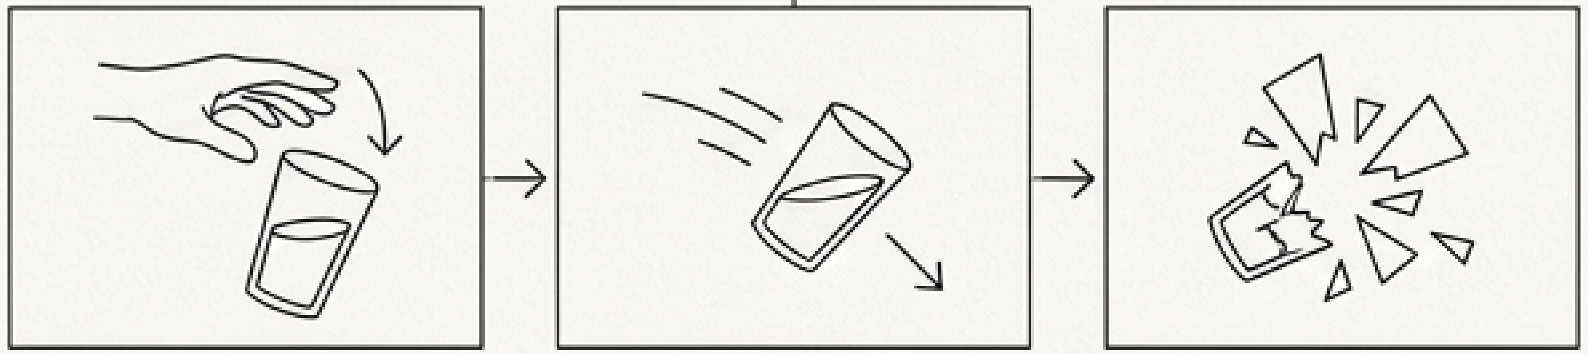
But human creativity involves conscious intent and emotional resonance.



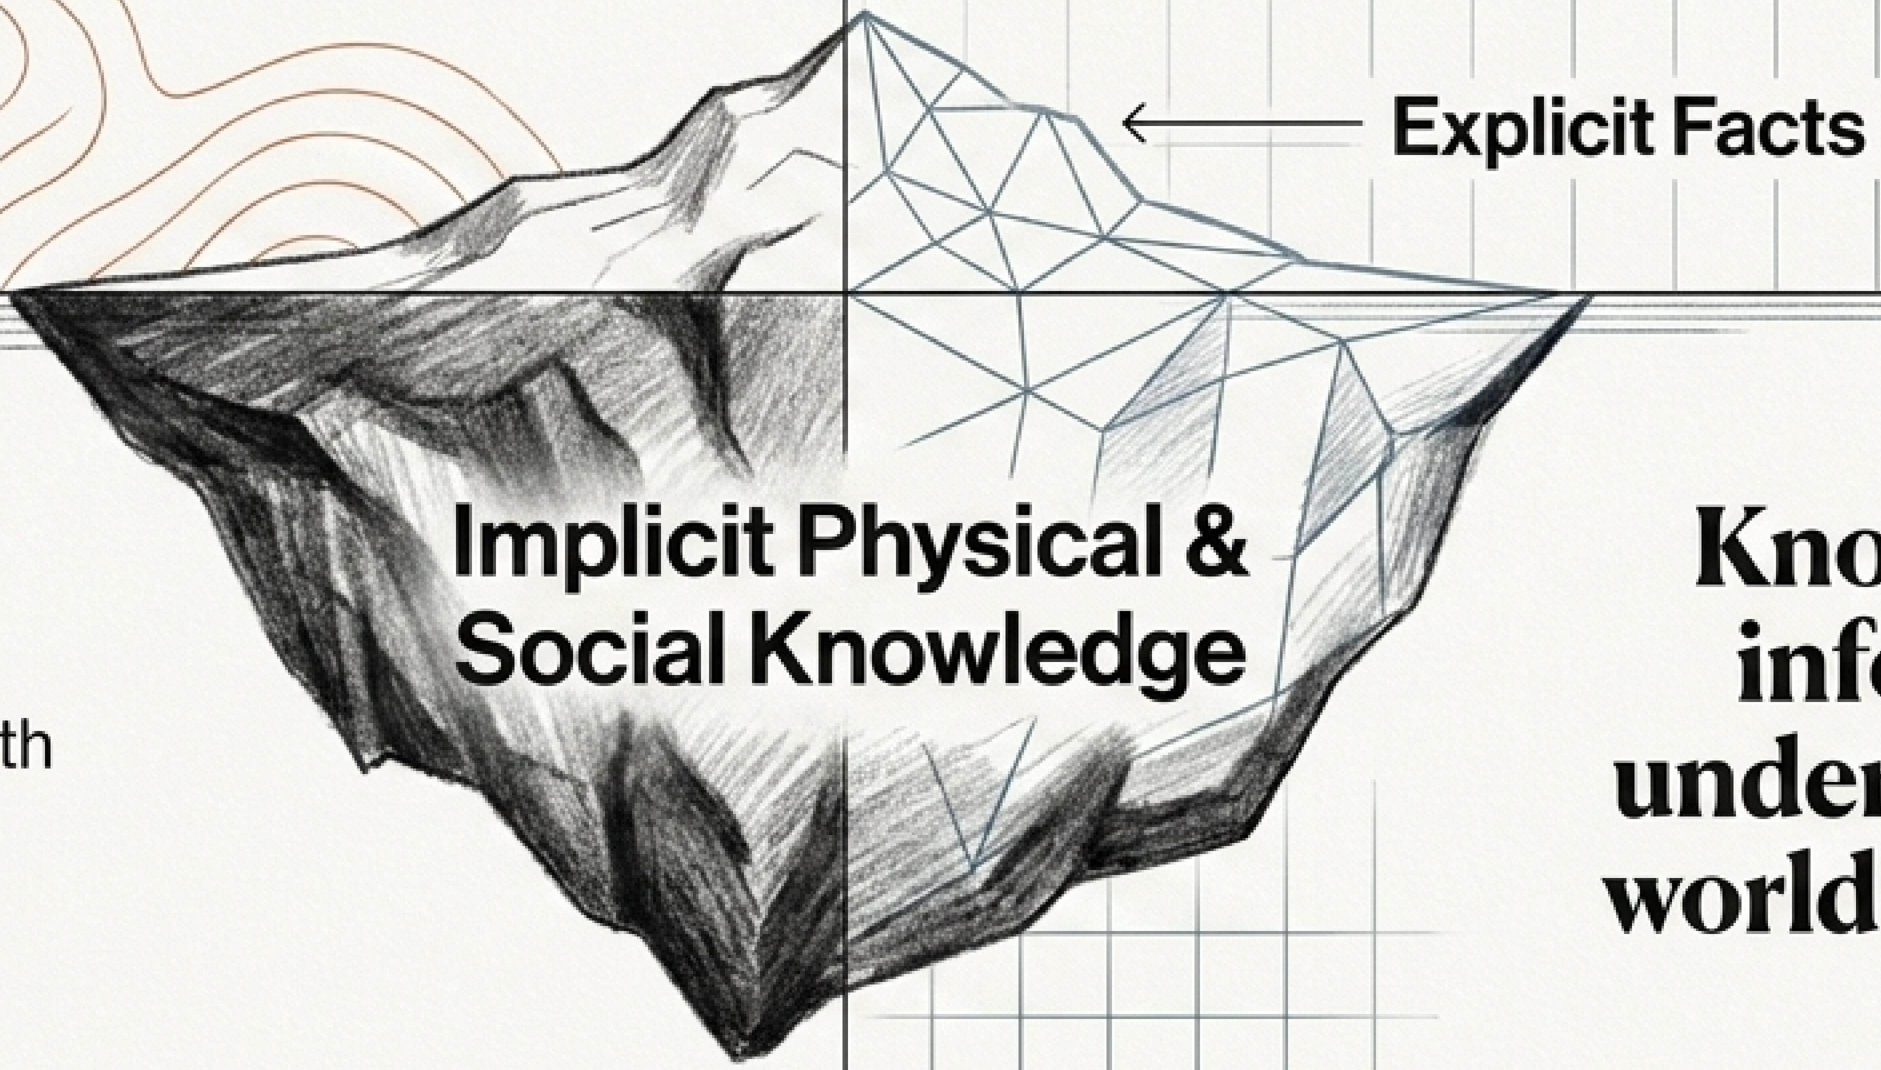
AI can undoubtedly produce novel outputs across media.

AI generation works through learned patterns and computational processes—the definition of creativity remains fiercely debated.

# The Strange Problem of Common Sense



Glass → falls → probably breaks.



Humans automatically understand everyday facts.

AI systems often struggle with implicit physical, social, or contextual knowledge.

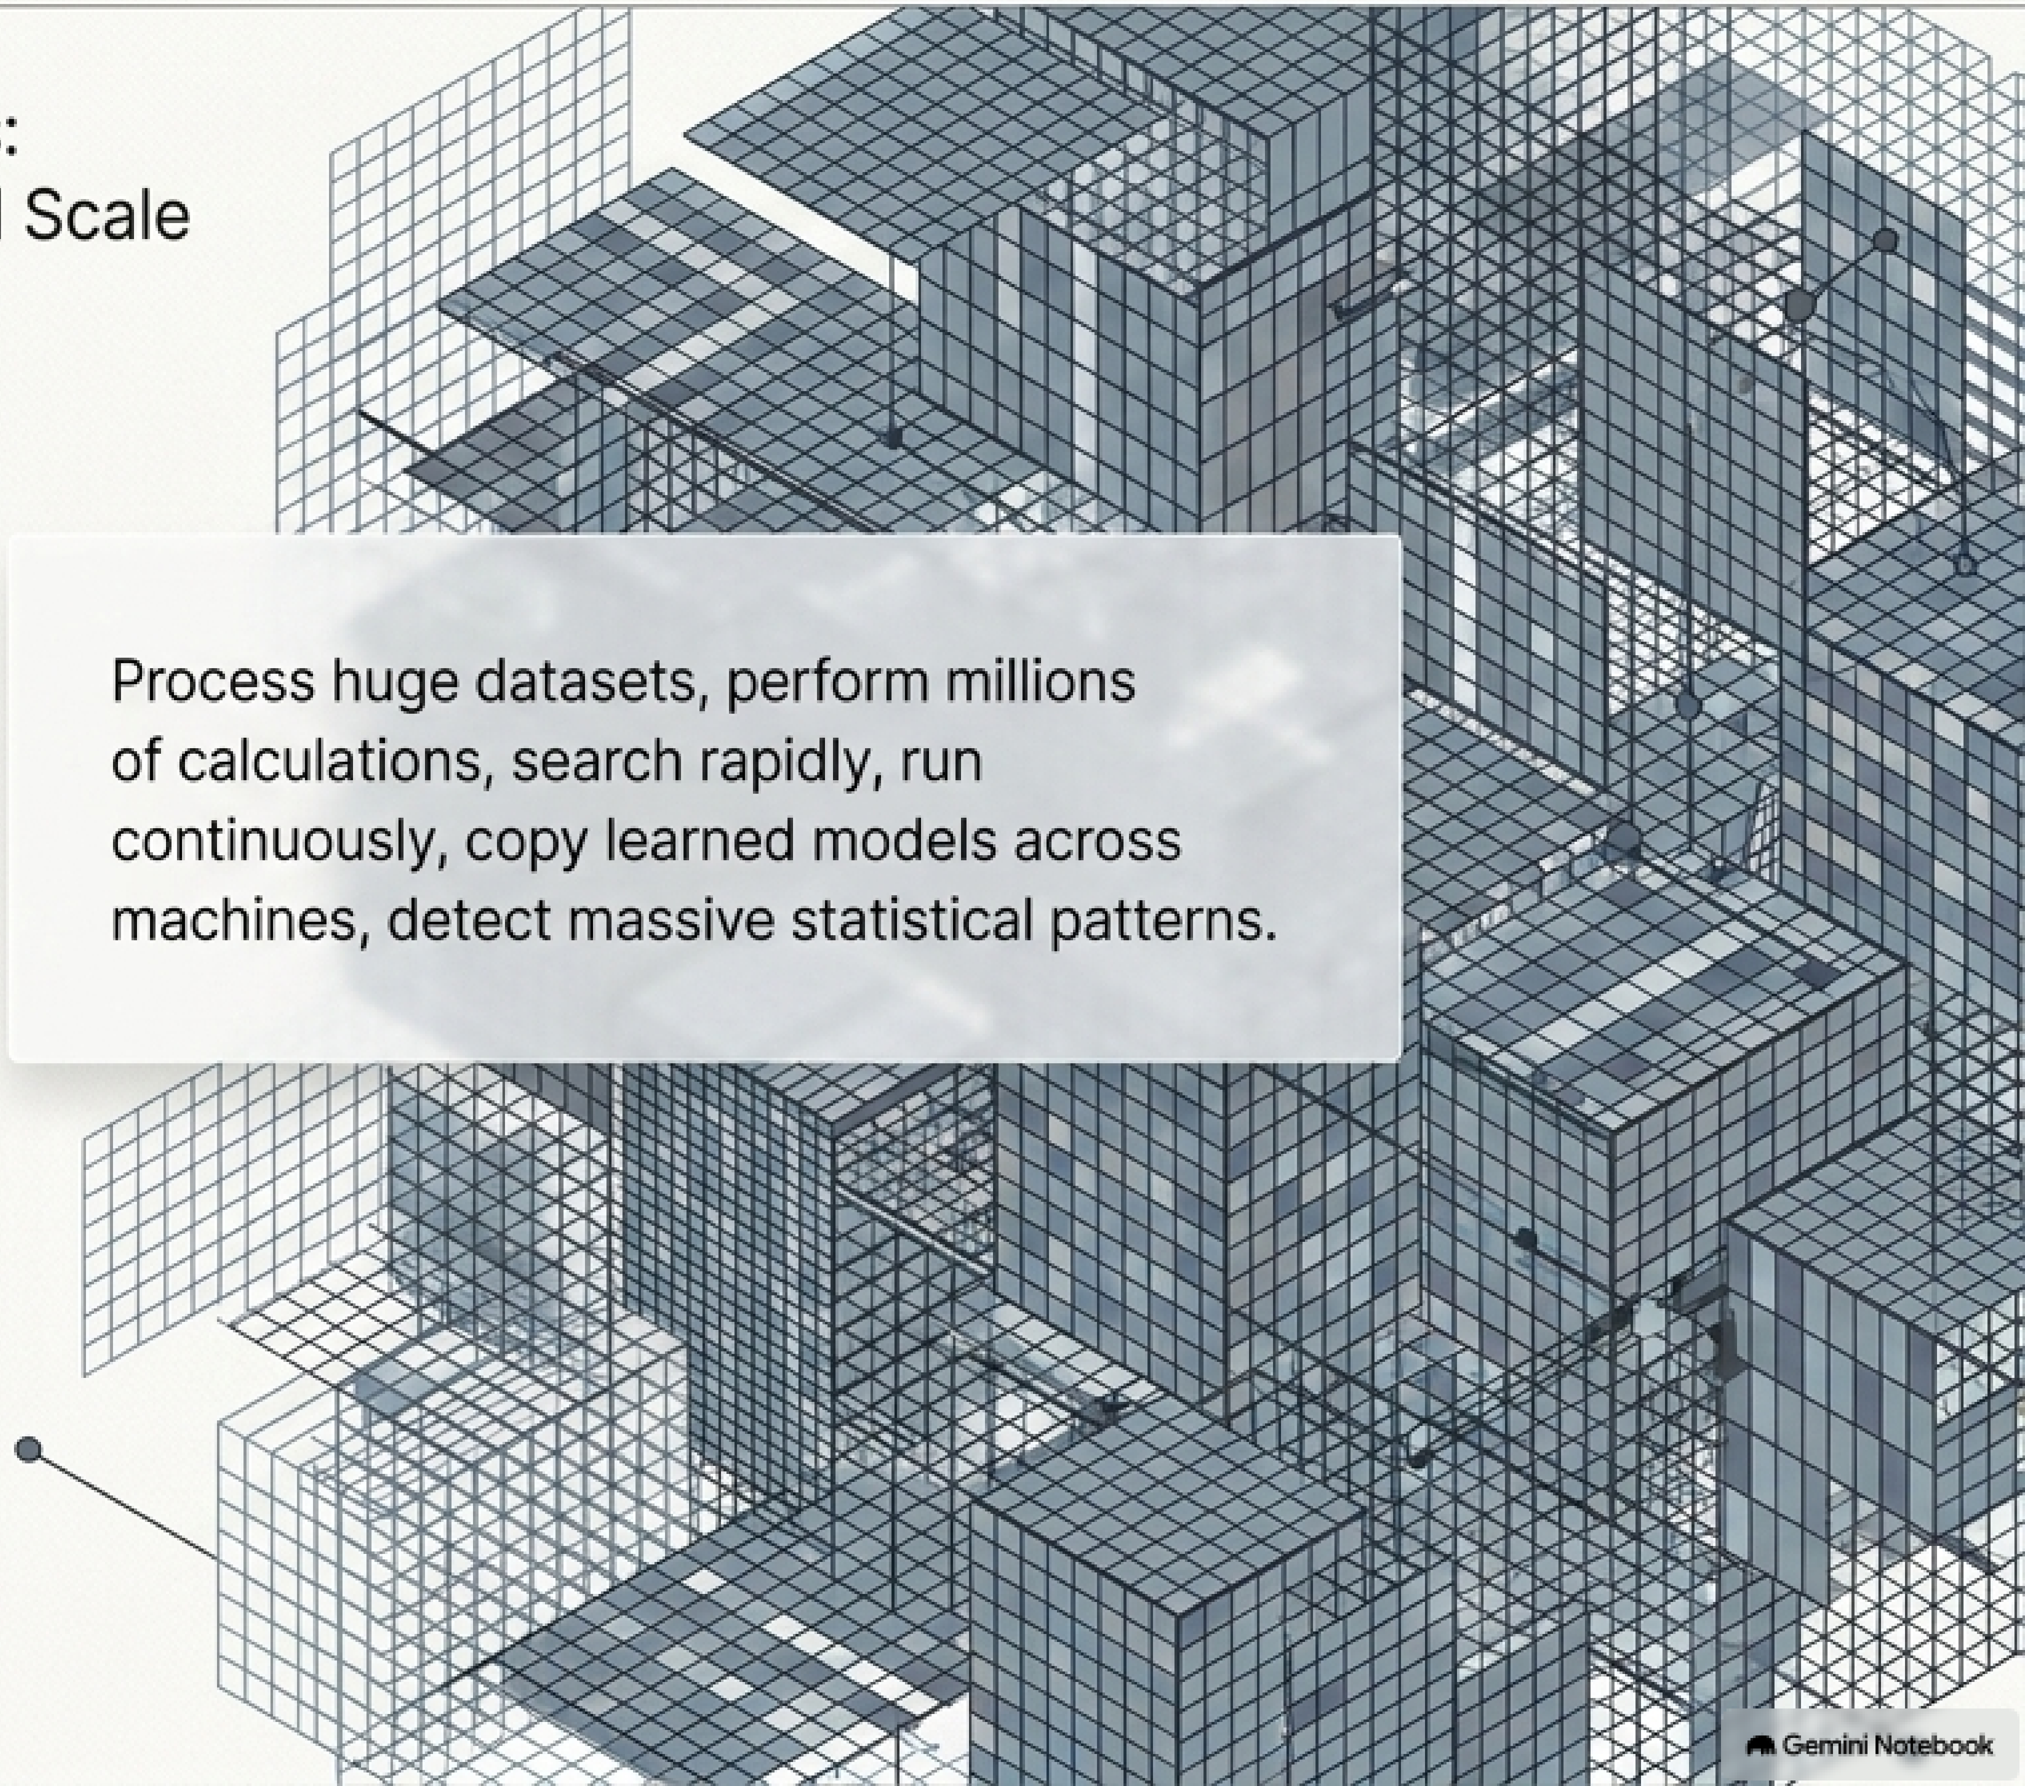
**Knowing lots of information ≠ understanding the world like a human.**

Modern models are improving rapidly, but robust common-sense reasoning remains an active research area.

# The Blueprint of Minds

## Where Silicon Dominates: Unimaginable Speed and Scale

Cannot manually analyze 1 billion transactions.



Process huge datasets, perform millions of calculations, search rapidly, run continuously, copy learned models across machines, detect massive statistical patterns.

# The Communication Disconnect

I need 8 hours of sleep.

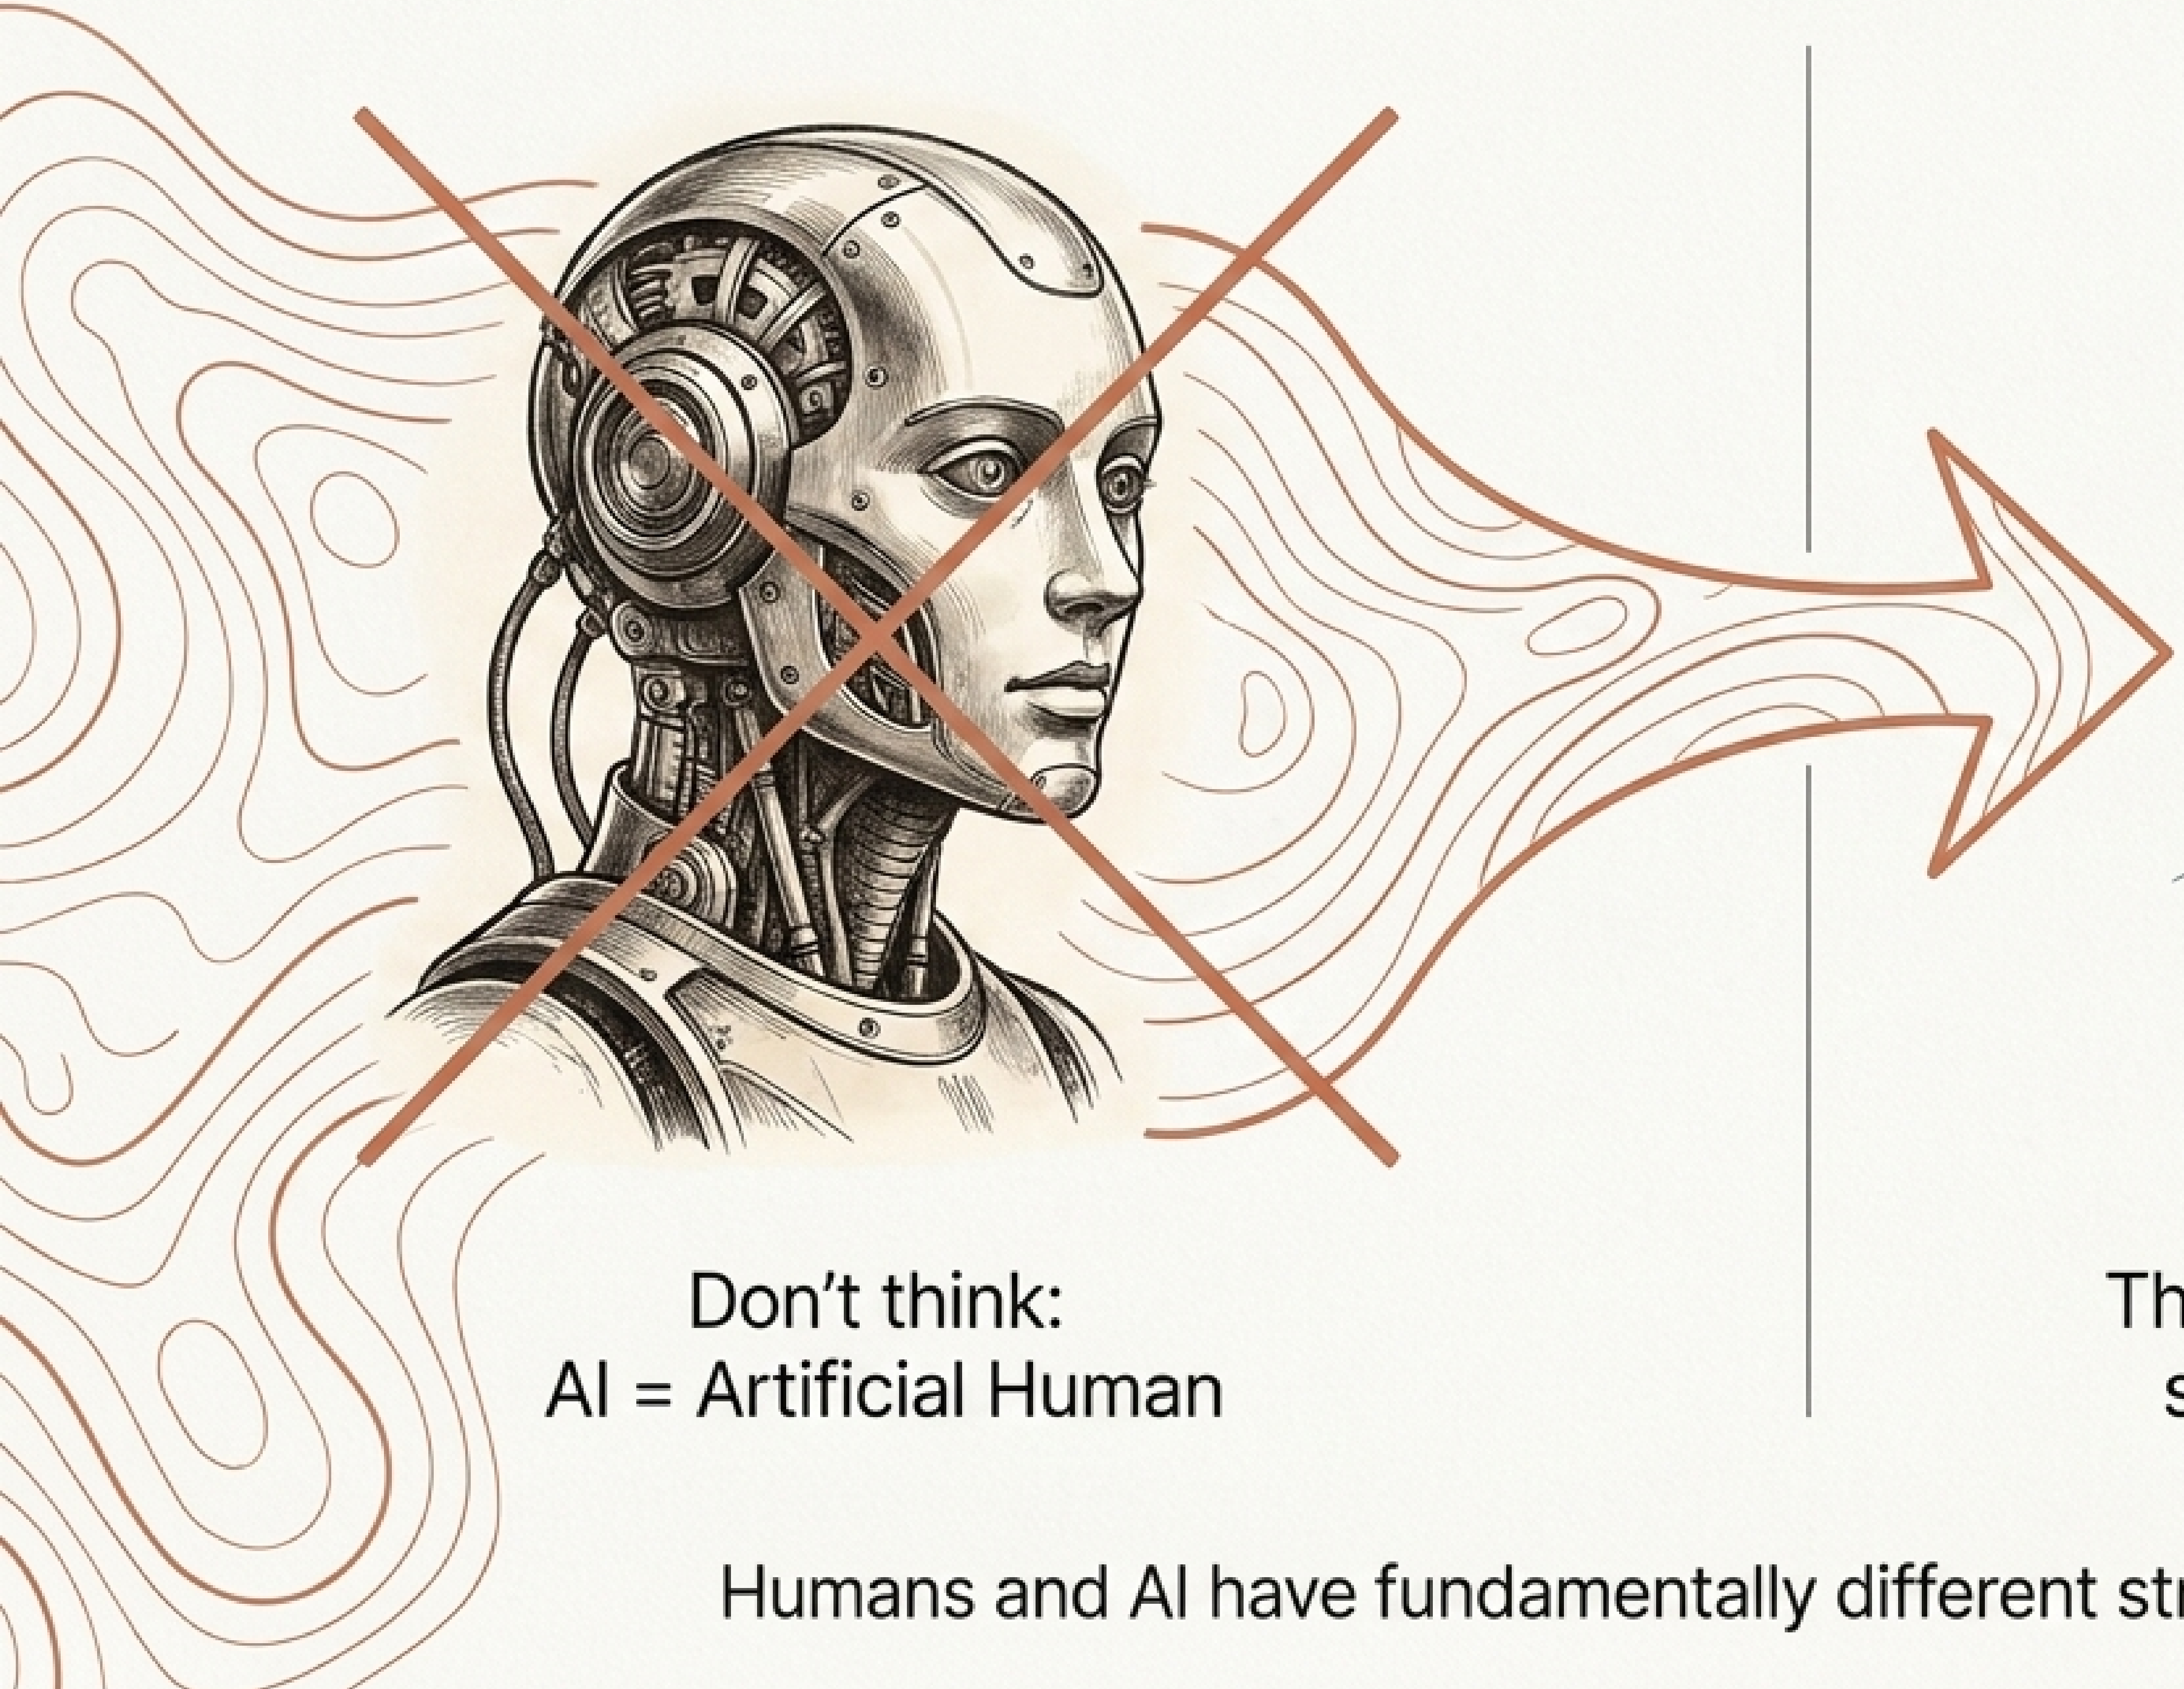
I processed 10 million examples.

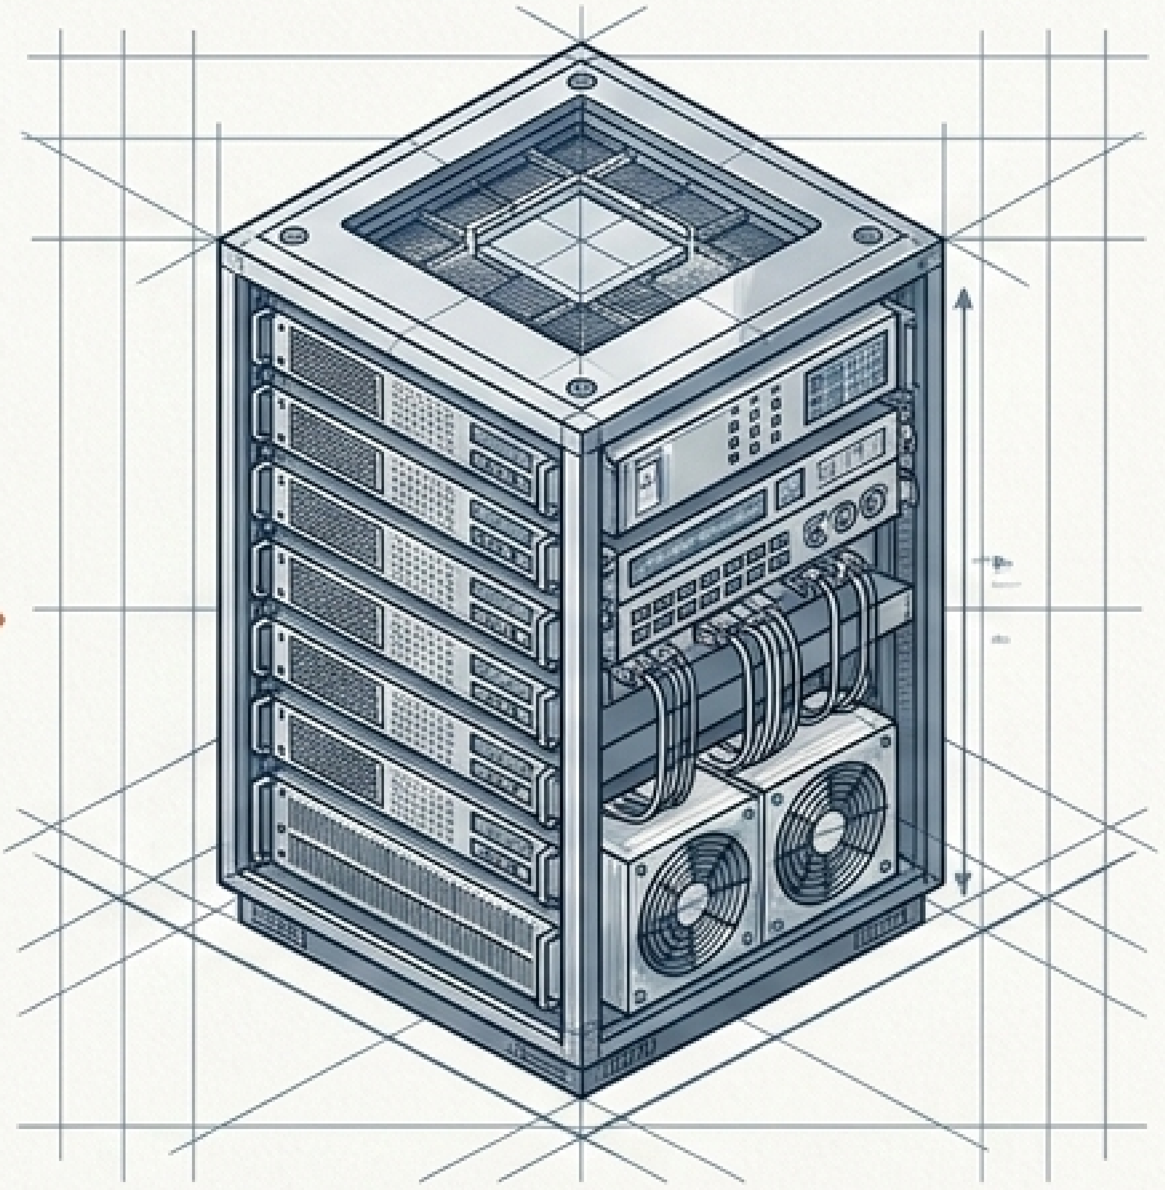
Can you understand how I feel?

I can generate a paragraph explaining emotions.

That's not what I asked. 💀

# Stripping away the science fiction



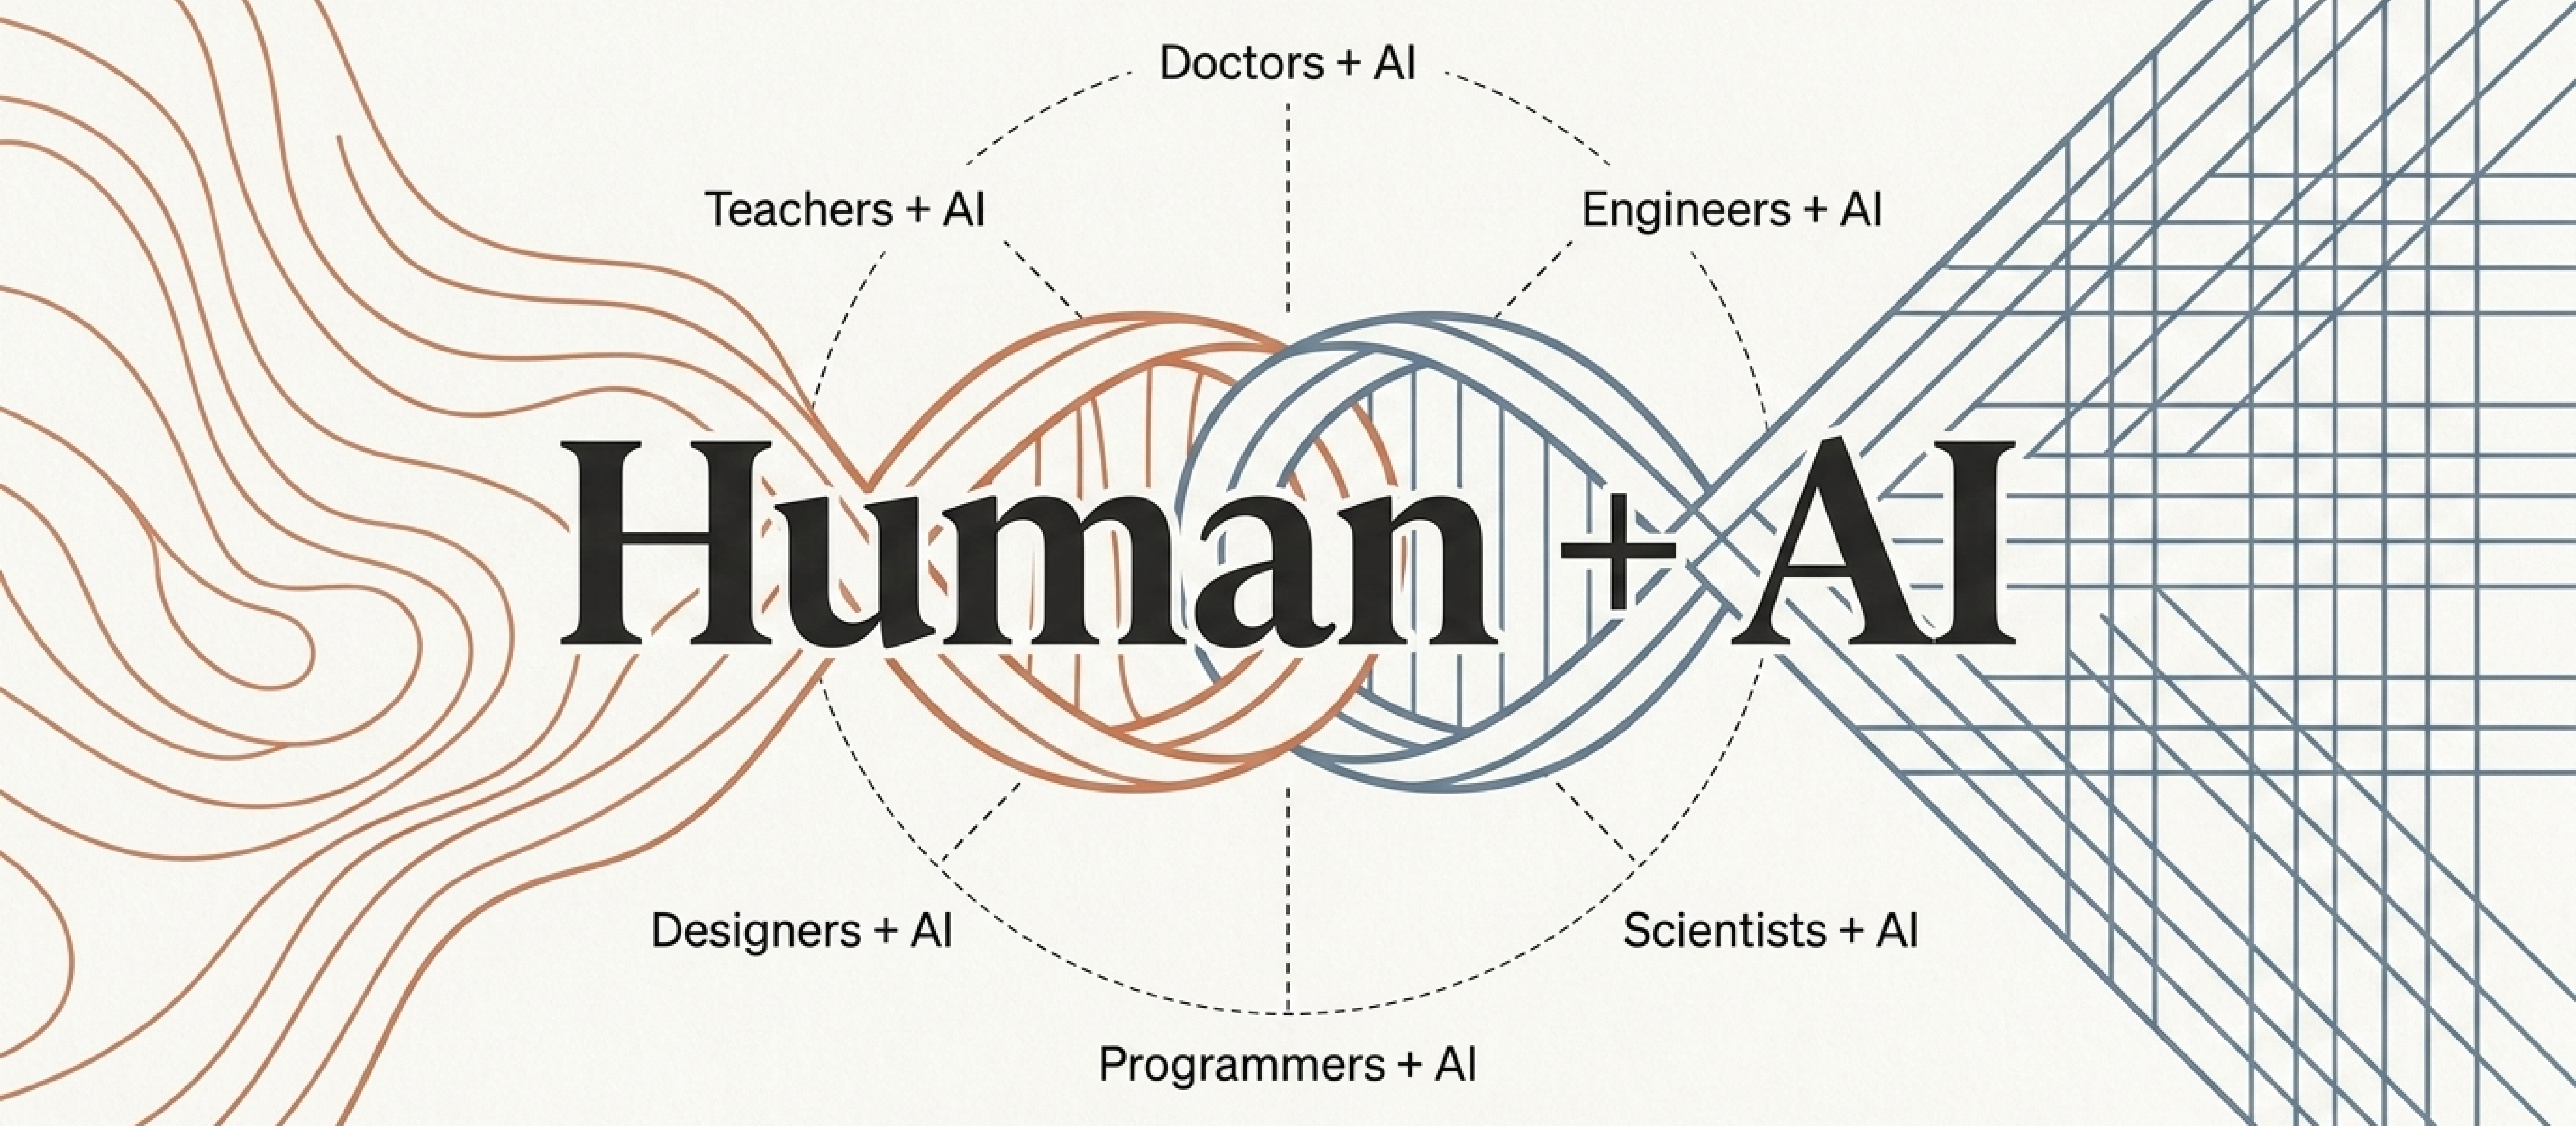


Don't think:
AI = Artificial Human

Think: AI = Engineered computational systems with specific capabilities.

Humans and AI have fundamentally different strengths and limitations.

# The comparison doesn't have to be Human VS AI.



AI is a tool to augment human capability.

# The Ultimate Intelligence Scorecard

| Ability | Humans | AI |
|---|---|---|
| Processing speed | ◓ | ● |
| Huge-scale computation | ○ | ● |
| General adaptability | ● | ◓ |
| Real-world experience | ● | ◑ |
| Pattern recognition | ● | ● |
| Memory capacity | ◓ | ● |
| Common sense | ● | ◓ |
| Creativity | ● | ◓ |
| Energy efficiency | ● | ○ |
| Emotional experience | ● | ? |

*Note: These comparisons depend heavily on the specific AI system and task.*

The Final Takeaway

# The interesting future isn't necessarily AI replacing humans.

# **It's increasingly humans who know how to use AI outperforming humans who don't.**
